Map My Block

Helping India Map Cencus Better

Archana Prabhath

The Problem

Mapping 1.4 Billion People data on Scratch Paper

Enumerators handle census duties on top of their full-time government jobs.

- The 200-House Crunch: Each enumerator must navigate remote terrain and map ~200 households in just 30 days.

3.1 Million
Overworked Field Staff

The Problem

The Process Bottleneck:

- Manual A3/A4 Sketches: The Government issues physical paper sheets for drawing complex Houselisting Block boundaries by hand.
- The Back-and-Forth Delay: Inaccurate, hand-drawn paper maps trigger endless revision loops between field workers and supervisors, stalling the entire national timeline.

The Technology Gap: Existing digital mapping tools demand intensive training, complex logins, or heavy, desk-bound GIS software.

The Solution

From Freehand Artistry to Data-Driven Automation

Mathematical Precision over Human Error

Standardization for Seamless Verification

The Solution

Instead of forcing field workers to act as amateur sketch artists, the system uses satellite, OpenStreetMap, and Google building infrastructure to instantly generate the map's structural framework.

Eliminates structural distortion and guesswork. By maintaining flawless aspect ratios, the application provides an accurate foundation, reducing the process to a simple, error-free physical trace.

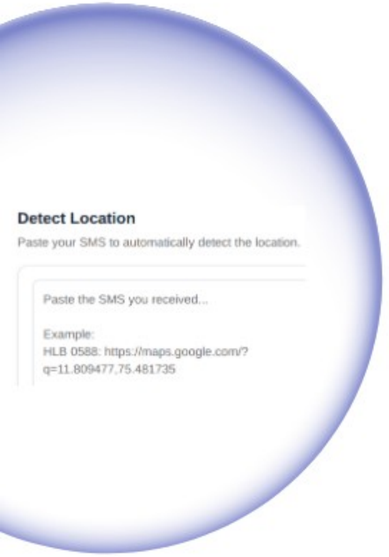

Replaces inconsistent, smudged hand-drawings with clean, crisp, standardized "Survey of India" style layouts complete with official legends, allowing supervisors to verify data instantly without back-and-forth delays.

Removes barriers to entry by utilizing localized language support (Malayalam) to align seamlessly with the active field workforce on the ground.

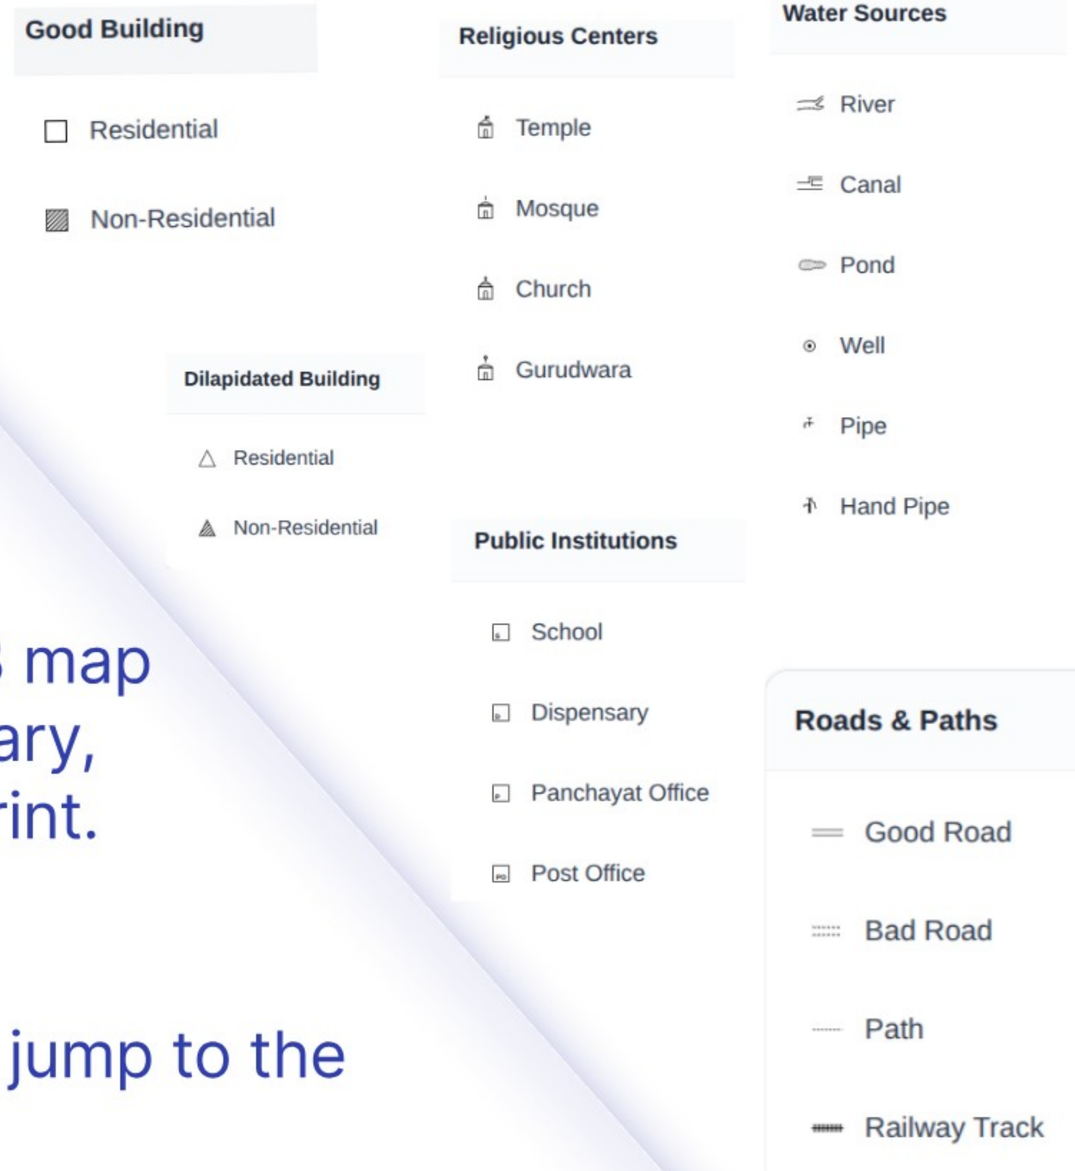

Product

Lightweight PWA — mobile-first

Generate a hand-drawn-style HLB map from your uploaded layout, boundary, tags, and landmarks — ready to print.

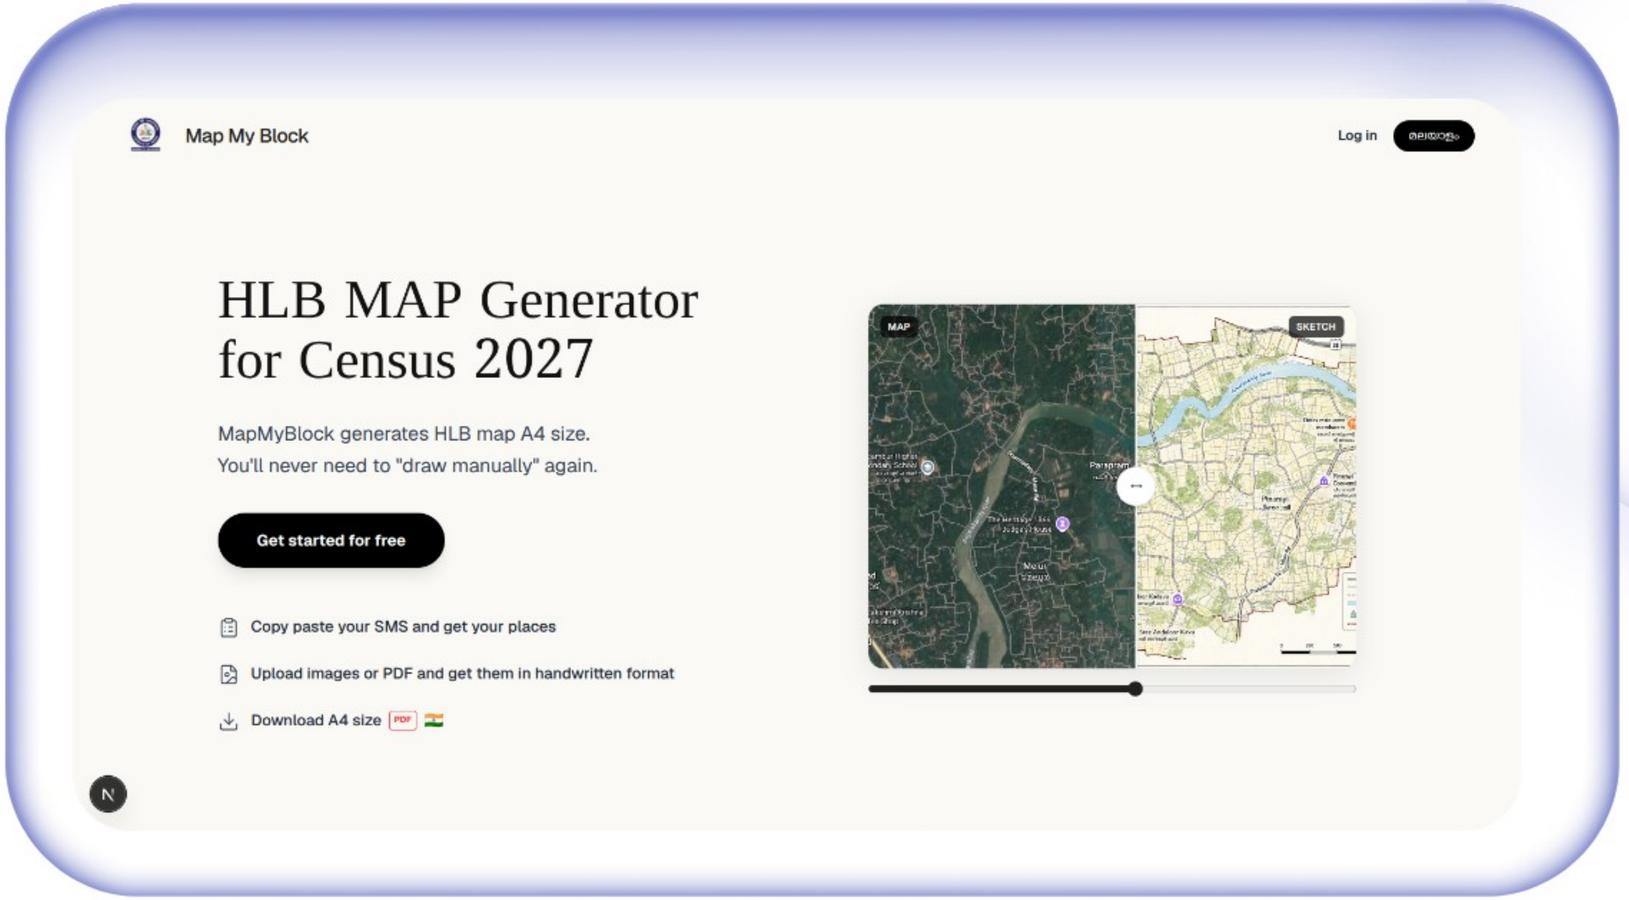

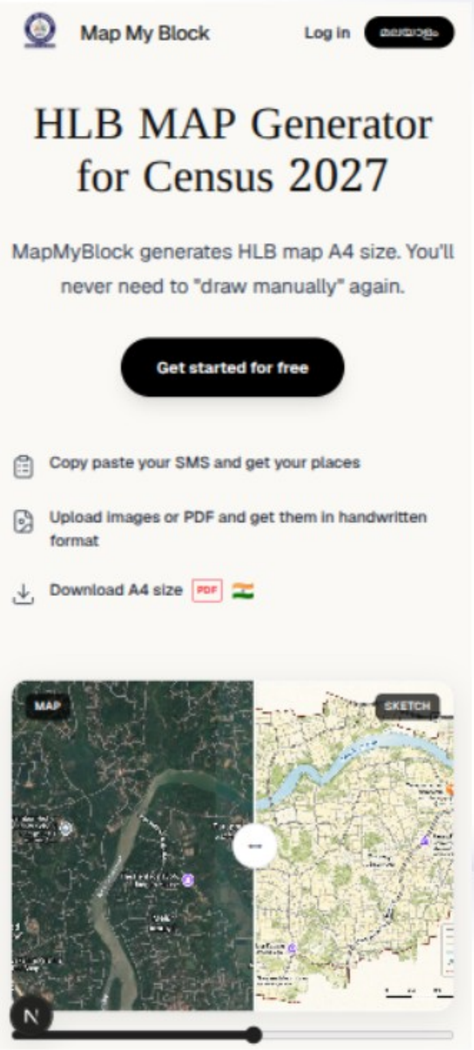

Fetch Coordinates from SMS and jump to the right place

The Product

Census work shouldn’t depend on drawing skill. Enumerators already have too little time hand-drawn HLB sketches steal what’s left and still come out inconsistent.

Makers

This product exists because millions of volunteers mapped the world first

OpenStreetMap contributors: every road, school, temple, pond, and place name we fetch

OpenStreetMap Foundation: the free map of the world

Nominatim: search & reverse geocoding

Overpass API: (and community mirrors) roads, water, forests, landmarks on demand
